OR, odds ratio calculated by the multiple logistic regression model; SE, standard error.

Reference group: air conditioning used in the main space where the respondent spent time outside the home, had an air conditioner at home, and did not restrict air conditioner use due to electricity bills.

Covariates: sex, residential area, job, type of housing, number of household members, relative poverty (defined as a monthly household income less than 50% of the standard median income), obesity (body mass index $\geq 25 \text{ kg/m}^2$), and presence of a chronic disease.
